Pro-insulin is produced by treating recombinant precursor protein with a mercaptan to provide 2-10 SH residues per Cys residue, in presence of a chostropic agent and in aq. medium of pH 10-11. Lieuting the prod. with 3-50 q hydrophobic adsorber resin per 1 aq. medium of pH 4-7, isolating the adsorber resin and pro-insulin and desorbing the pro-insulin. This method produces pro-insulin and desorbing the pro-insulin. This method produces pro-insulin with correctly bonded Cys bridges. Compared with known methods it involves fewer stages (esp. no sulphibitojes) or cyanogen bromide cleavage) and overail losses during purification are reduced, i.e. the process is quirker and gives better yields. Sequences of issulin chain A, B and C are given in AAK68895-97. Sequences of pro-insulin chain A, B and C are given in AAK68895-97. (Updated on 25 MAR-2001 to correct PN 11:01)

```
This sequence represents a human insulin precursor comprising insuling A and B chains. This insulin precursor is a component of the chimeric protein and B chains. Thois usulin precursor is a component of the chimeric protein and a cleavable at vivor in AAV42861. These chimeric proteins additionally contain an extension in AAV42861. These chimeric protein and a cleavable of vivor in AAV42861. These chimeric protein and a cleavable of vivor in AAV42861. These chimeric protein and a cleavable of the chimeric protein are contained in the chimeric protein are contained in the chimeric protein as as as intramolecular chaperone (IMC) for the insulin precursor, of terminal first estates which enables the hGH portion of the chimeric protein to be Lemoved after folding of the contain insulin via an hGH-proinsulin chimeric protein cofficient in the interesting of the fuse of herman insulin via an hGH-proinsulin chimeric protein and decrease not only protect insulin sequences from intracellular degradation by a microorganism host, but also promote the fusion proteins, thus allowing roiding of the fuse interactions among the fusion proteins, thus allowing roiding of the fuse of provider and decrease the intermolecular interactions among the fusion proteins, thus allowing roiding of the fuse of provider in middly setul has convential ions in protein and convential ions in the fuse of protein and the fuse of protein and acceptance of the fuse of protein and acceptanc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 FVNQHLCGSHLVEALYLVCGERGFFYTPKTR3TVEQCCTSTCSLYGLENYCN 52

Involves fewer stages (esp. no sulphitolysis or cyanogen bromide cleavage) and overall losses during purification are reduced, i.e. the process is quicker and gives better yields.
Sequences of insulin chain A, B and C are given in AAR68895-97.
Sequences of pro-insulin 1-4 are given in AAR68898-901.

                                    The present sequence is an example of a proinsulin molecule corresp. to the general formula R2-R1-(B2-B29-Y-X-Gly-A2-A20)-R3 (II) In formula (II), X = Lys, Arg or a peptide of 2-35 amino acids contg. Lys or Arg at the N- and C-termini; Y = a natural amino acid; R1 = Contg. Arg or Lys, a peptide of 2-45 amino acids contg. Arg or Lys at the N- and C-termini; R3 = a natural amino acids contg. Arg or Lys at the N- and C-termini; R3 = a natural amino acids contg. Arg or Lys at the N- and C-termini; R3 = a natural amino acids contg. Arg or Lys at the N- and C-termini; R3 = a natural amino acids contg. (A2-A20) and (B2-B29) are the insulin R9- and B-chain sequences contg. (A2-A20) and (B2-B29) are the insulin R- and B-chain sequences recombinant E.coli) is reacted with mercaptum at a ratio of 2-10 SH residues of mercaptan per Cys residue of proinsulin. The reaction control of the presence of a chaotropic auxiliary agent at the parameter of a chaotropic auxiliary agent at the print trypsin and opt. carboxypeptidase B yields correctly folded insulin. The insulin is isolated by absortion on the correctly and control on the correctly and control of the correctly control.

Pro-insulin is produced by treating recombinant precursor protein with a mercaptan to provide 2-10 SH residues per Cys residue, in presence of a chaotropic agent and in aq. medium of pH 10-11, reating the product with 3-50 g hydrophobic adsorber resin per I ag medium of pH 4-77, isolating the adsorbed resin and pro-insulin and desorbing the pro-insulin. This method produces pro-insulin with correctly bonded Cys bridges. Compared with known methods it
                                                                                                                                                                                                                                                                                             involves fewer stages (esp. no sulphitolysis or cyanogen bromide cleavage) and overali losses during purification are reduced, i.e. the process is quicker and gives better yields.
                                                                                                                                                                                                                                                                                                                                                                                                              Sequences of insulin chain A, B and C are given in AAK68895-97 Sequences of pro-insulin 1-4 are given in AAK68999-901. ```
Commonder (hdf) of the sequence given in A442855, a cleavable peptide linker (AA42857), and a human insulin presursor comprising linkulin An42857), and a human insulin presursor comprising linkulin and a change of the sequence given in A442857, and a human insulin presursor comprising linkulin as an intramolecular chaperone (HWC) for the insulin precursor.

C. terminal Asq residue which enables the holl portion of the removed atter iolding hest taken place. Production of recombinant human insulin via an holl proinsulin chimeric protein can provide human insulin with correctly linked cysteine bridges with provide human insulin with correctly linked cysteine bridges with of human insulin. The IMC sequences not only protect insulin sequences from intracellular degradation by a microorganism host, but also promote the fusion protein and decrease the intermolecular interactions among the fusion proteins, thus allowing foliging of the fusion proteins, thus allowing foliging of the fusion proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         at commercially useful high concentrations. The procedural steps of cyanogen bromide clevage, oxidative sulphitolysis and related purification steps on thus be eliminated, along with the use of high concentrations of mercaptan or the use of hydrophobic absorbent resins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents a chimeric protein, half-mini-proinsulin.
This chimeric protein contains an N-terminal fragment of human growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Length 107;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score 294; DB 20;

AAQ86425 encodes AAR71692 mating factor alpha I-Insulin precursor ArgB31. ArgB31 comprises the B and A chains of a claimed human insulin derivative. In the final claimed compose, they are covalently connected via disulphide bonds between Cys residues A7/B7 and A20/B19. The derivative, which may be present as a zinc ion complex, can be used as a fast action treatment for disbetcs. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 EVNQHLOSSHLVEALZLVGGERGFFYTPKTRGTVEDGOTSTCSLZQLENYCN 52

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A new method for the production of recomtinant human insulin comprises folding a hybrid polypeptide comprising prolimation and conditions that permit correct disulphide bond formation and subjecting that folded protein to enzymatic cleavage. The insulin produced can then be purified. This sequence is a SOB-insulin a chain hybrid polypeptide and is encoded by chain. Any insulin A chain hybrid polypeptide and is encoded by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  identical to the natural hormone. Hazardous and combersome procedures involving evanouen bromide and sulphitolysis to protect SH groups are avoided since the entire hybrid polypeptide folds efficiently to the native structure even with the leader attached
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              the plasmid construct pbBAST-LAT. Transformation of the proper icola host cells with pbBAST-LAT results in the efficient expression of the prointain hybrid polypeptide, useful for human insulin production. The method produces recombinant human insulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 FVNQHLCGSHLVEALYLVCGERGFFYTPKTRGIVEOCCTSICSLYQLENYCN 52
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DB 17: Length 116:

                                                                                                                                                                                                                                                                                                                                     ANUMENAZO encodes AAR71694 mating factor alpha 1-insulin precursor Angli, Argalal Neterminal EDARAEAR. The insulin precursor comprises the B and A chains of a claimed human insulin derivative preceded by the Neterminal amino acids EDABAEAR. In the final ciaimed compstitutes are covalently connected via disulptime bonds between Cystresidues A7/87 and A20/819, the derivative, which may be present as a zinc ion complex, can be used as a tast action freatment for
       Human insulin precursor ArgB1, ArgB31; d abetes; Zinc ion complex; mating factor alpha 1; N-terminal EEAEAF \kappa_{\rm c}

AAQ86432 encodes AAk71695 mating factor aipha 1-Insulin precursor Arg81, Arg81 Niterminal EEA NEAER. The insulin precursor comprises the B and A chains of a claimed human insulin derivative preceded by the Niterminal amino acids EEAEARER. In the final claimed companties are covalently connected via disulphide bonds between Cystresiducs A7/R3 and A20/R89. The derivative, which may be present as a zinc ion complex, can be used as a last action treatment for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Insulin; precursor; growth hormone; chaperone, intramolecular;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 14
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAR11899
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0
                                                                                                                                                                                                                 This sequence represents a chimeric protein, which contains an Kiterminal fragment of human arowth hormone (165) of the sequence given in AAVA265, a cleavable peptide linker (AAVA2657), and a broman lisuich procursor comprising instain A and B claims (AAVA2659). The BH portion of the claimstain procursor, and follows a control of the instance provided an experience of the instance provided an experience of the claimstance of the chamber has a Citerminal Ara residue which challes the host praction of the chamber that is because the perfect to be removed after folding has taken place.
                                                                                                                                                                                                                                                                                                                                                                                                     interactions among the fusion profess. Thus allowing folding of the fused insulin precursor at commercially useful high concentrations. The procedures steps of eyanogen bromide cleavage, oxidative sulphitolysis and related purification steps can thus be eliminated, along with the use of high concentrations of mercaptan or the use of hydrophobic absorbent
                                                                                                                                                                                                                                                                                                                   Production of recombinant human insulin via an hGH-profusulin chizeric protein can provide human insulin with correctly linked cystice bridges will fewer necessary procedural steps, and hence resulting in a higher yield of human insulin. The IMC sequences not only protect insulin sequences from intracelular degradation by a microorganism host, but also promote the folding of the fusei insulin precursor, lacilitate the solubility of the fusion protein and decrease the intermojecular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /label-Lys residue linking insulin B chain to A chain
                                                                                                                                                         New chimeric proteins containing human growth hormone fragment, used particularly for the production of human insulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Proinsulin analogue with a Lys residue 'inking the A and B chains.

Human insulin; recombinant production; amorphous; monospherical form; diabetes mellitus.
                                                                                                                                                                                                                                                                                              This sequence is a specific example of an insulin derivative which can be obtained in amorphous, monospherical form by dissolving in an orpropanol/buffer mixture (pH 4.5-6.5) having n-propanol content 15% relative to water. The solution is then diluted with water to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Amorphous, mono-spherical form of insulin derivs. For treating diabetes mellitus, are produced by diluting soln. in aq. isopropanol, are stable when dried or in suspension
                                                                                This buman insulin precursor has correct y positioned disalphide bridges between the A and B chains and i more resistant to proteolytic digestion than prior art insulin precursors. Yeast strains transformed with DNA encoding this precursor can be cultured to secrete it in high yields. The precursor can be conveited into mature human itsulin by transpeptidation. See also AAR1897-98.

SEQUENCE 5. Application no. US20020164712A1

GENERAL INFORMATION:

GENERAL INFORMATION: Chimeric Protein Containing an TITLE OF INVENTION: Chimeric Protein Containing an ADPRESSE: Townsend and Townsend and Crew LLP STREET: Townsend and Townsend and Crew LLP STREET: Townsend and Townsend and Crew LLP STREET: Two Embarcadero Center, Eighth Floor CITY: San Francisco STATE: California COUNTRY: USA

COUNTRY: USA

ZIPPER READABLE: FORM:

MEDIUM TYPE: Patentin Release F::0, Version #1.36

CUMPUTER: Patentin Release F::0, Version #1.36

CLASSIFICATION NUMBER: US/10/054,873

FILING DATE: 11-MR-1998

APPLICATION NUMBER: WO PCT/CN98/00052

FILING DATE: 11-MR-1998

APPLICATION NUMBER: US 09/423,100

FILING DATE: US 09/423,100
```

LENGTH: 52 amino acids

TYPE: amino acid
